WATERBLASTERS PRINCIPLES OF USE

Cleaning power is a function of both pressure and volume output which basically equates to the horsepower input.

In general terms the harsher the blasting job the more pressure that is required and the greater the volume the faster the job can be carried out.

For cleaning jobs rather than blasting lower pressures are required, however greater volumes still allow a faster job.

All technical information provided by Splash Equipment Ltd is provided as a guideline and whilst every endeavor has been made to ensure its accuracy, no guarantee is given or implied and all operators should carry out trials to obtain best results.
